

AAFP-AAHA Feline Life Stage Guidelines

Background and goals Cats have become the most popular pet in the United States, yet statistics about veterinary care for cats remain troubling.¹ Although most owners consider their cats to be family members, cats are substantially underserved, compared with dogs.

In 2006, owners took their dogs to veterinarians more than twice as often as cats, averaging 2.3 times/year, compared with 1.1 times/year for cats, and significantly more dogs (58%) than cats (28%) were seen by a veterinarian one or more times/year.² Cat owners often express a belief that cats 'do not need medical care'. Two reasons for this misconception are that signs of illness are often difficult to detect, and cats are perceived to be self-sufficient.² One role of the veterinarian is to develop a partnership with cat owners that will pave the way for a lifelong health care plan. These guidelines aim to outline an evidence-based life stage wellness program to aid the veterinary medical team in delivering the best comprehensive care for cats. Specific goals are to provide:

- ❖ Recommendations for optimal health care for cats throughout the different life stages.
- ❖ Practical suggestions and tools to facilitate improved veterinary visits and to enhance the client-veterinarian clinical encounter.
- ❖ A foundation from which to access sources of additional information.

Life stage classification Distinct life stages (age groups) in cats are not well defined, in part because individual animals and body systems age at different rates, a process that is influenced by many factors. These guidelines follow one convenient classification (see box below). These age designations help to focus attention on the physical and behavioral changes that occur at different stages (eg, congenital defects in kittens, obesity prevention in the junior cat). It must be recognized, however, that any age groupings are inevitably arbitrary demarcations along a spectrum, and not absolutes.

Evidence-based health care Supporting references for specific recommendations are supplied where possible, and any previously published guidelines on particular topics are referred to where relevant. Readers should note, however, that the guidelines panel was hampered in its efforts by the relative paucity of disease incidence data by age group that is available, and there is an urgent need for research to guide the future of evidence-based feline health care.³

Getting started: the wellness exam

To achieve optimum feline health care, veterinarians must help owners to understand and appreciate the importance of regular preventive care for their cats at all ages. A consistent message from the entire health care team is crucial, beginning with the first kitten visit and reinforced during subsequent visits. Early detection of clinical abnormalities and behavioral changes can improve disease management and quality of life.^{5,6}

How frequent?

The panel supports the recommendations of the American Association of Feline Practitioners (AAFP) and American Animal Hospital Association (AAHA) that a minimum of annual wellness examinations and consultations for all cats is justifiable. More frequent examinations may be recommended for seniors and geriatrics, and cats with medical and behavioral conditions.

Life stages in cats

Life stage	Age of cat	Human equivalent	
 Kitten birth to 6 months Tigger 3 months old	0 – 1 month	0 – 1 year	
	2 – 3 months	2 – 4 years	
	4 months	6 – 8 years	
	6 months	10 years	
 Junior 7 months to 2 years Sugar 13 months old	7 months	12 years	
	12 months	15 years	
	18 months	21 years	
	2 years	24 years	
 Prime 3 years to 6 years Rosie 3 years old	3	28	
	4	32	
	5	36	
	6	40	
 Mature 7 years to 10 years Nemo 8 years old	7	44	
	8	48	
	9	52	
	10	56	
 Senior 11 years to 14 years George 13 years old	11	60	
	12	64	
	13	68	
	14	72	
	 Geriatric 15 years+ Chinrose 16 years old	15	76
		16	80
17		84	
18		88	
19		92	
20		96	
21		100	
22		104	
23		108	
24		112	
25		116	

These guidelines follow a convenient life stage classification developed by the Feline Advisory Bureau and adopted in the recent AAFP Senior Care Guidelines.^{4,5} Six age groupings are defined, from kitten through to geriatric

A minimum of annual wellness examinations and consultations for all cats is justifiable. Semi-annual wellness exams are often recommended for all feline life stages by veterinarians and veterinary organizations.

FIG 1 The benefits of regular wellness exams often are not immediately apparent to pet owners and need to be well explained.
Courtesy of Ilona Rodan

Semi-annual wellness exams are often recommended for all feline life stages by veterinarians and veterinary organizations. Their reasoning includes the fact that changes in health status may occur in a short period of time; that ill cats often show no signs of disease; and that earlier detection of ill health, body weight changes, dental disease, and so on, allows for earlier intervention. In addition, semi-annual exams allow for more frequent communication with the owner regarding behavioral and attitudinal changes, and education about preventive health care. Further research is needed to identify the optimal examination schedule to maximize the health and longevity of the cat.

The panel members concluded that preventive veterinary care can improve quality of life, detect illness earlier and, therefore, reduce the long term expenses associated with a cat's health care. They believe that cat owners are willing to seek more veterinary care when it improves quality of life and detects illnesses earlier, thereby reducing the long term expenses associated with their cat's health care. Improved client communication and education of the benefits of regular veterinary care are essential to achieve that goal (Fig 1).

The reasons pet owners have cited for not seeking care were that they did not know it was necessary, the veterinarian did not recommend it, and the need or benefit was not well explained.⁷ Other obstacles include the cat's stress or fear associated with veterinary visits and the practical difficulties of transporting cats to receive veterinary care. Suggestions for overcoming such barriers are provided on page 45.

History-taking

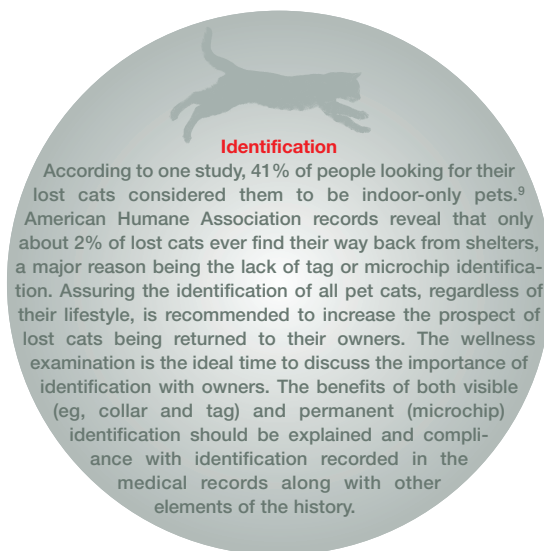

It is not the intent of the panel to reiterate the basics of the veterinary visit, but instead to offer a checklist to assist the veterinarian (see Table 1). Where relevant, aspects of feline behavior, nutrition, and various disease prevention and detection strategies are expanded on in the text.

History-taking includes the use of open-ended questioning (eg, 'How has [cat's name] been doing since the last visit?').⁸ This approach is often combined with a template or checklist, such as given in Table 1, to ensure important aspects are not overlooked.

Physical examination

When performing the physical exam, particular attention should be paid to:

- ❖ Observing the cat from a distance to assess breathing patterns, gait, stance, strength, coordination and vision.
- ❖ Changes in parameters from prior exams (body weight, body condition score [BCS], vital signs).
- ❖ Other specifics as noted in the discussion/action items in Table 1.

The minimum database

Although specific data documenting benefits are not available, the panel concluded that regular wellness examinations and collection of the minimum database (MDB; Table 2) can be valuable, allowing early detection of disease or trends in clinical or laboratory parameters that may be of concern. Additionally, it provides a baseline for interpretation of data recorded at subsequent visits.

Overcoming barriers to veterinary visits

The panel recommends that the veterinary team endeavours to make the veterinary encounter comfortable for both cat and client. Integral to this is a better understanding of feline behavior.^{10,11} Some specific tips to help minimize the challenges associated with bringing a cat to the clinic are given below.

Once the client arrives at the veterinary clinic, the health-care team can take steps to reduce stress for both the client and the cat, as is feasible for their situation.¹² See below for some ideas for the waiting client and cat, and some tips to facilitate examination and treatment.

Reducing the stress of transport

- ❖ Socialize kittens to the carrier and to travelling:
 - Keep the transport carrier out and accessible in the home.
 - Create and maintain a positive association with the transport carrier by making it a comfortable resting, feeding or play location.
 - When feasible, and if the cat is neutral or favorably inclined to car travel, encourage owners to take the cat on periodic car rides paired with positive experiences.
- ❖ Withholding food prior to travel may prevent motion sickness, increase interest in treats at the clinic, and is beneficial if blood is to be collected.
- ❖ Apply a calming synthetic pheromone to, and/or place familiar clothing from a favorite person in, the carrier on a routine basis and just prior to transport.^{13,14}
- ❖ Provide cover/hiding options in or over carrier (eg, blanket draped over carrier) during transport.

SUPPLEMENTARY DATA

An AAFP position statement entitled 'Respectful handling of cats to prevent fear and pain' is available at www.catvets.com and included in the online version of this article at doi:10.1016/j.jfms.2009.12.006

Making the cat and client comfortable at the clinic

- ❖ Provide a separate waiting room for cats, or ensure their immediate placement into an exam room.
- ❖ Minimize waiting times.
- ❖ Provide elevated platforms in the waiting area so owners can place cat carriers out of reach of dogs.
- ❖ Use calming synthetic pheromones in the environment.¹⁴

Facilitating the examination and treatment

- ❖ Provide a cat-friendly exam room:
 - Keep the room and table warm, with a non-slip surface for the cat.
 - Avoid loud noises or ambient sounds that may mimic hissing (eg, whispering).
 - Distract and reward with tasty treats/catnip/play.
- ❖ Handle using minimal restraint:
 - See AAFP Feline Behavior Guidelines for tips on handling cats during the veterinary examination.¹⁰
 - While gathering historical information, allow the cat time to adjust to the surroundings by removing the top or opening the door of the carrier. The cat should ideally remain in the bottom half of the carrier for as much of the exam as possible; this allows it to adjust to the examiner and the environment.^{15,16}
 - Allow the cat to hide partially under a towel; use towels, rather than scruffing, for handling where additional restraint is needed.
 - Avoid making eye contact with the cat.
 - Determine the most comfortable position for the cat during the examination, such as the veterinarian's lap.
 - Use sedation, anesthesia or analgesics as indicated to reduce stress and/or pain.
- ❖ Keep hospitalized cats away from dogs and out of visual range of other cats.¹⁷

TABLE 1 Wellness visit: discussion and action items (continued on page 47)

	General discussion/ action items ALL AGES	Specific discussion/action items					
		KITTEN (0–6 m)	JUNIOR (7 m–2 y)	ADULT (3–6 y)	MATURE (7–10 y)	SENIOR (11–14 y)	GERIATRIC (15+ y)
General	Educate/discuss: ❖ Recommended frequency of veterinary visits (the panel recommends a minimum of annual exams) ❖ Early and subtle signs of pain or illness; importance of prevention and early detection of disease ❖ Health-care financial planning ❖ Disaster preparedness ❖ Estate planning ❖ Microchipping	Discuss: ❖ Breed health-care predispositions ❖ Claw care and alternatives to declawing ❖ Congenital/genetic concerns		This age group is often overlooked and would benefit from regular veterinary care		Specific management of mature and older cats is described in the AAFP Senior Care Guidelines ⁵ and AAHA Senior Care Guidelines for Dogs and Cats ¹⁸	
Behavior and environment*	Ask about: ❖ Housing (indoor/outdoor) ❖ Hunting activity ❖ Children and other pets in the home ❖ Environmental enrichment (eg, toys, scratching posts) ❖ Behavior ❖ Travel (regional diseases)	❖ Confirm adequate resource allocation and play with appropriate toys ❖ Teach commands (eg, come, sit) ❖ Acclimate to car and veterinary visits	❖ Inter-cat interactions and social play may decline or deteriorate with maturity ❖ Provide continued training to allow manipulation of mouth, ears and feet	❖ Review environmental enrichment ❖ Teach techniques to increase the cat's activity (eg, retrieve) ❖ Encourage object and interactive play as a weight management strategy	Increased importance of good/easy accessibility to litter box, bed, food	❖ Environmental needs may change (eg, with osteoarthritis): ensure good/easy accessibility to litter box, soft bed, food ❖ Educate clients about subtle behavior changes that are not 'just old age'	❖ Ensure accessibility to litter box, bed, food ❖ Monitor cognitive function (vocalization/confusion), signs of pain/osteoarthritis ❖ Discuss quality of life issues
Medical/surgical history; sterilization	Ask about: ❖ Previous medical/surgical history ❖ Medications ❖ Over-the-counter items (eg, supplements, parasiticides, alternative medications)	Discuss sterilization, including pros and cons of surgery at different ages	❖ Sterilization, if not yet done ❖ Discuss establishing baseline data to assess subsequent changes (weight, BCS, MDB, etc)*	Discuss baseline adult data to assess subsequent changes (weight, BCS, MDB, etc)*	❖ Monitor for subtle changes such as increased sleeping or decreased activity ❖ Increase focus on mobility, duration and/or progression of any specific signs	Increase focus on mobility, duration and/or progression of any specific signs	Increasing importance for regular review of medications and supplements
Elimination*	Discuss: ❖ Urinary tract health and methods of encouraging healthy litter habits ❖ Elimination habits (frequency, quantity and quality), and litter box management (number, size, location, cleaning, etc)	Litter box set-up, cleaning and normal elimination behaviour ¹⁰	Confirm that litter box size accommodates growing cat		Review the size and edge height of litter box to ensure the cat can enter easily as it ages	Adjust litter box size, height and cleaning regimes as necessary	

*See text discussion. m = months, y = years, BCS = body condition score, MDB = minimum database

TABLE 1 Wellness visit: discussion and action items (continued)

	General discussion/ action items ALL AGES	Specific discussion/action items				
		KITTEN (0–6 m)	JUNIOR (7 m–2 y)	ADULT (3–6 y)	MATURE (7–10 y)	SENIOR (11–14 y)
Nutrition and weight management*	<ul style="list-style-type: none"> ❖ Discuss eating behavior, diet(s) and feeding recommendations ❖ Stress importance of regular assessment of weight and BCS 	<ul style="list-style-type: none"> ❖ Feed to moderate body condition ❖ Discuss growth requirements and healthy weight management ❖ Introduce to a variety of food flavors/textures¹⁹ 	Monitor for weight changes and feed to moderate body condition. (Caloric needs decrease after sterilization and increase in breeding females)	Feed to moderate body condition. Monitor for weight changes and modify food intake accordingly		Feed to moderate body condition. Monitor food intake and BCS/weight changes
Oral health*	<ul style="list-style-type: none"> ❖ Discuss dental health and home care ❖ Monitor and discuss dental disease, preventive care, dental prophylaxis and treatment 	Educate/discuss: <ul style="list-style-type: none"> ❖ Mouth handling, teeth brushing and alternatives ❖ Permanent tooth eruption (timing and signs) Coordinate: <ul style="list-style-type: none"> ❖ Any required deciduous tooth care with sterilization (simultaneous anesthesia) 	Monitor and discuss			Monitor for oral tumors, and inability to eat and decreased quality of life from painful dental disease
Parasite control*	<ul style="list-style-type: none"> ❖ Tailor laboratory evaluation to lifestyle ❖ Evaluate changing or different risk based on geographic prevalence and travel ❖ Discuss zoonotic risks. Heartworm prevention recommended for all cats in endemic areas²⁰ 	Deworming every 2 weeks from 3–9 weeks of age; then monthly until 6 months of age. Fecal exams 2–4 times during the first year of life	Continue fecal exams 1–4 times/year depending on health and lifestyle factors	Conduct fecal exams 1–2 times/year, depending on health and lifestyle factors		
Vaccination ^{21,22}	Core vaccines: <ul style="list-style-type: none"> ❖ Feline panleukopenia virus ❖ Feline herpesvirus 1 ❖ Feline calicivirus ❖ Rabies virus Tailor: <ul style="list-style-type: none"> ❖ Vaccine protocols to individuals and state regulations, considering benefits and risks, environment, and referring to current guidelines 	FeLV vaccine highly recommended for kittens due to unknown future lifestyle. Review, complete, continue vaccination series	Review, complete, continue vaccination series. Review vaccine history/viral screening	Continue core vaccines as per current guidelines. Evaluate risk assessment and use of non-core vaccines, if indicated, as per current guidelines		

*See text discussion. m = months, y = years, BCS = body condition score

TABLE 2 The minimum database by age group

	Kitten/junior	Adult	Mature	Senior/geriatric
CBC Hematocrit, RBC, WBC, differential count, cytology, platelets	+/-	+/-	+	+
CHEM screen As a minimum include: TP, albumin, globulin, ALP, ALT, glucose, BUN, creatinine, K ⁺ , phos, Na ⁺ , Ca ²⁺	+/-	+/-	+	+
Urinalysis* Specific gradient, sediment, glucose, ketones, bilirubin, protein ²³	+/-	+/-	+	+
T4*		+/-	+/-	+
Blood pressure*		+/-	+/-	+
Retroviral testing	+	+/-	+/-	+/-
Fecal examination*	+	+	+	+

*See text discussion. CBC = complete blood count, RBC = red blood cells, WBC = white blood cells, CHEM = chemistry, TP = total protein, ALP = alkaline phosphatase, ALT = alanine aminotransferase, BUN = blood urea nitrogen, T4 = thyroxine

Specific recommendations about age and frequency of laboratory testing depend on many factors.^{5,18,24} One consideration in determining this frequency is that the incidence of many diseases increases as cats age. Guidelines for management of mature, senior and geriatric cats may be found in the AAFP Senior Guidelines.⁵ Retroviral testing is discussed in detail in the AAFP Retrovirus Testing Guidelines.²² Measurement of blood pressure is discussed in detail in the ACVIM guidelines.²⁵ Although limited incidence studies have been performed to identify the age of onset of hyperthyroidism in cats, the panel recommends that veterinarians strongly consider T4 testing in the apparently healthy mature cat. More robust incidence data is needed to develop firmer recommendations.

Nutrition and weight management

Diet basics

Energy and nutrient needs vary with life stage, sterilization status and activity, and so general feeding recommendations provide only a starting point. Individual intakes must then be adjusted to maintain the desired weight and body condition score (Fig 2).

Satisfactory diets for cats contain all the required nutrients in proper balance, are palatable and digestible, and are free of spoilage and contaminants. The specific source of nutrients in feline diets is irrelevant when these criteria are satisfied.²⁶ Both canned and dry food have been found to support health

during all life stages.²⁷ The presence of a label guarantee that the food was tested using feeding trials provides the current best initial evidence that a diet is satisfactory.

The panel examined published peer-reviewed evidence-based studies in healthy, client-owned cats for any significant health effect of: feeding canned versus dry food (including contribution to dental health); providing a variety of foods versus a consistent diet; feeding high protein, low carbohydrate versus lower calorie and high fiber diets; feeding raw diets; providing dietary supplements, or access to grass or plants. Based on the available data, specific recommendations in favor of any of these practices cannot be made.

Despite the concern surrounding the effects of carbohydrate in dry foods, current evidence suggests that housing and activity (which may be a marker of welfare)²⁸ are more significant predictors of health.²⁹⁻³² Evidence does

FIG 2 Regular assessment of weight and body condition score is important in cats of all ages – and this needs to be stressed to owners. Expressing any changes in weight as a percentage, or in terms of an equivalent weight loss/gain in humans, can be helpful. Courtesy of Deb Givin

Cat owners are willing to seek more veterinary care when it improves quality of life and detects illnesses earlier, thereby reducing the long term expenses associated with their cat's health care.

not support the carbohydrate content of foods as being harmful or an independent risk factor for diseases such as obesity or diabetes.^{29,33}

With regard to home-made foods, the veterinarian should discuss and share evidence about nutritional balance, risks associated with preparation and feeding of foods raw, and advantages of using food formulated for cats, referring clients to additional resources if required (Table 3).

Feeding regimens

A variety of feeding styles can maintain good health in client-owned cats, including free choice or provision of meals. In addition to monitoring intake, considerations include:

- ❖ Providing water via bowls, dripping faucets and/or fountains, to promote adequate intake. When increased water intake is desirable, feeding of canned foods may help achieve this.
- ❖ Locating food in a quiet area, especially for nervous or fearful cats (eg, away from other animals or household items that may make noises intermittently).³⁴
- ❖ Offering dry foods in foraging devices (eg, food balls or puzzles),³⁵ and in multiple small meals in several widely dispersed bowls to slow intake and increase mental and physical activity.

Weight management

Obesity may occur at any age, but is most commonly encountered in middle age.^{32,36} The risk of obesity may be reduced by environmental enrichment, increasing opportunities for activity, and individualizing food intake. The energy density of cat foods varies widely, based on the moisture and fat content of the diet. This information should be helpful in determining a guideline of how much to feed.

Tips and items for discussion with clients include:

- ❖ Slowly (<10% increments and decrements) adjust calorie intake to life stage and conditions (eg, sterilization, indoor housing).
- ❖ Provide environmental enrichment to increase activity.³⁵
- ❖ Switch to a diet with lower energy density (reduced fat, increased air, fiber and/or moisture).
- ❖ Change the feeding strategy.
- ❖ Switch to meal feeding, with portion control.
- ❖ Introduce foraging devices (see above).
- ❖ Introduce barriers to food access (eg, baby gates, elevated feeding stations).

Appropriate environmental enrichment is essential for maintaining the mental and physical well-being of cats.

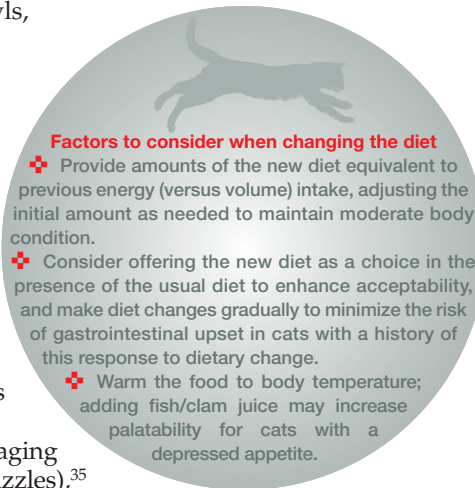

Behavior and environment

An outline of behavior and environmental items for discussion at each life stage is presented in Table 1. The following discussion elaborates on those items, where applicable. For detailed recommendations about normal cat behavior and management refer to the AAFP Feline Behavior Guidelines.¹⁰

All ages

- ❖ Provide plentiful resources – hiding spots, elevated resting spots, food, water, scratching posts and litter boxes – throughout the home, particularly for cats kept indoors and in multi-cat households (Fig 3).
- ❖ Controversy exists over whether cats should be kept indoors-only or in an indoor/outdoor environment (see box below). These debates reflect geographical and cultural differences, as well as individual owner preferences.^{30,37–41} They underline the importance of providing an appropriate and stimulating environment for the cat.³⁵

Lifestyle choices

❖ **Indoor-only** An indoor-only lifestyle may decrease the risks of trauma and certain infectious diseases and increase longevity, but may also increase the risks of compromised welfare and illness due to environmental limitations. Appropriate environmental enrichment is thus essential for maintaining the mental and physical well-being of cats.^{10,42–44}

❖ **Indoor/outdoor** An indoor/outdoor lifestyle may provide a more natural and stimulating environment for cats, but may also increase the risks of infectious disease and trauma, and result in increased predation on wildlife. Supervised or controlled outdoor access, for example via leashed walks or cat-proof enclosures, may reduce some of the risks otherwise associated with access to the outdoors, and has been recommended by the AAFP and others.^{10,40,44}

SUPPLEMENTARY DATA

Table 3, with hyperlinks to the listed web resources, is available at
doi:10.1016/j.jfms.2009.12.006

FIG 3 Environmental needs change with life stage, although environmental enrichment and adequate resource allocation remain important for all cats. While play and play items are a priority for the kitten and junior (a and b), easy access to a soft bed (c) and a comfortable resting spot, such as a sofa (d), assumes more importance in the senior and geriatric cat. Pictures (a), (b) and (d) courtesy of Deb Givvin; (c) courtesy of Ilona Rodan

Kitten

❖ **Play** Kittens have a high play drive; inter-cat social play peaks at about 12 weeks of age,⁴⁵ then object play becomes prevalent. Toys offer an outlet for normal predatory sequences as part of play, and help prevent play biting.

❖ **Litter boxes** Litter box set-up and cleaning is critical for box usage. Although individual preferences can vary, most cats prefer clumping litter⁴⁶ and a clean box in an accessible but not busy location. Initially, kittens can be simultaneously offered a variety of litter box options to permit them to express personal preference through usage. Some cats may find scented litters aversive.⁴⁷

❖ **Socialization/handling** Kittens should be gradually and positively acclimated as early as possible to any stimuli or handling techniques that owners plan them to encounter during their lifetime (eg, children, dogs, nail trims, tooth and coat brushing, car transport). This can be accomplished with food or other appropriate rewards, avoiding interactive punishment as it may elicit defensive aggression.

Junior

❖ **Inter-cat relations** The reduction in social play combined with the dispersal effect (when free-living offspring leave the family unit at about 1–2 years of age) means that inter-cat aggression may develop at this stage of life.

❖ **Litter boxes and elimination** Litter box rejection can stem from a variety of causes including litter type, box cleaning, box style, and box size. Cats have shown a tendency to prefer larger boxes.^{48,49}

❖ **Urine marking** Most intact cats and about 10% of sterilized cats mark their territory with urine.⁵⁰ The onset of this behaviour can coincide with sexual maturity.

Adult and mature

❖ **Play** Declining play activity increases susceptibility to weight gain. In one study, three 10–15 min exercise sessions per day caused a loss of approximately 1% of body weight in 1 month with no food intake restrictions.⁵¹

Senior and geriatric

❖ Senior and geriatric cats exhibiting behavioral changes (eg, vocalization, changes in litter box usage) should always be evaluated for an underlying medical problem.⁵

Parasites

Parasite control is important in cats of all ages. Prevention includes both animal and environmental control. The Companion Animal Parasite Council (CAPC) guidelines contain recommendations about prevention of ecto- and endoparasites, fecal testing, and more.²⁰ The United States Centers for Disease Control and Prevention website (see Table 3) also provides information on a variety of zoonoses. Items for discussion are listed in Table 1, and a few specifics are expanded on below.

Kittens

❖ Because prenatal infection does not occur in kittens, roundworm treatment given every 2 weeks can start at 3 weeks of age. Kittens may begin receiving a monthly general endoparasite preventive at 8–9 weeks of age.²⁰

Heartworm: key points

- ❖ Although the incidence in cats is lower than it is in dogs (10–15% of the rate in dogs), both indoor and outdoor cats are at risk of heartworm infection.
- ❖ Infection with even a small number of adult worms can cause severe disease.
- ❖ Signs differ from those in dogs, tending to be non-specific.
- ❖ A combination of antigen and antibody testing increases the probability of an accurate diagnosis.
- ❖ Adulticide treatment is currently not recommended for cats. There is no evidence that it improves survival in infected cats, and the death of adult worms can be life-threatening.
- ❖ Monthly prophylaxis is both safe and effective. Some heartworm preventives also provide control of other parasites.

Clients face a potentially overwhelming amount of information at each visit to the veterinarian, so effective communication is essential.

All life stages

- ❖ Feces testing allows monitoring of compliance with preventive medication as well as diagnosis of some endoparasites not treated by broad-spectrum preventives.
- ❖ Heartworm presents a risk at all life stages in endemic areas.⁵² Some points of note are listed in the box on page 51; additional details may be found on the websites of the CAPC and American Heartworm Society (see Table 3).

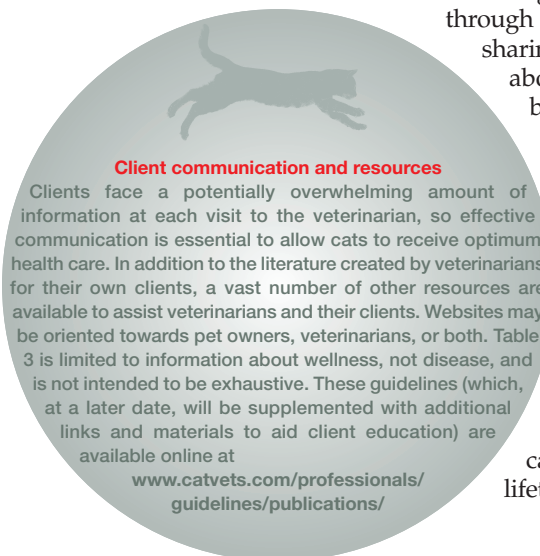

Vaccination

Table 1 outlines the vaccination priorities to consider when designing a comprehensive, life stage-targeted wellness plan for a cat.

Dental care

Diseases of the oral cavity are extremely common,⁵³ yet most owners are unaware that dental disease can threaten the health and welfare of their cat. The AAHA Dental Care Guidelines for Dogs and Cats provide details of dental care and dental charting.⁵⁴ Points of note include:

- ❖ Cats need home and veterinary dental care at *all* life stages (see Table 1).
- ❖ Disease affecting the teeth and/or oral cavity can cause pain and may lead to disease elsewhere in the body.
- ❖ A minimum schedule of annual examinations is recommended for cats with healthy dentition.⁵⁴
- ❖ Client education is fundamental since cats may not show overt signs of pain and discomfort associated with oral disease:⁴
 - Discuss owner-usable interventions that will maintain or improve dental health;⁵⁵ for example, conditioning at home using treats to allow oral examination by lifting the lips. Although best started with kittens, older cats can be taught to accept brushing using positive interactions and rewards.
 - Dental diets, treats and chews exist, but do not all have equivalent efficacy and none substitute for veterinary dental care.^{56,57} The use of dental treats and chews may be a realistic, practical alternative to daily tooth brushing, although data about their comparative efficacy is lacking. The Veterinary Oral Health

Council in the USA requires that strict standards are met before certification of food or treats for oral care.⁵⁸

Evidence-based wellness

Although the panel's objective to provide evidence-based guidelines for health care related to life stage was not fully realized, the profession could develop more accurate recommendations through further research and through cooperation and data sharing. More robust data about disease incidence by age would assist practitioners in determining the value and desired frequency of routine wellness testing. In the meantime, we must rely on the available data, personal knowledge and experience to help owners maintain their cat's health during its lifetime.

KEY POINTS

- ❖ These Life Stage Guidelines aim to enhance the health, welfare and longevity of cats by providing a concise template to help veterinarians, their staff and clients to improve preventive care.
- ❖ Excellent resources are available to facilitate the design of a comprehensive, life stage-targeted wellness care plan for each cat.
- ❖ Clear communication among veterinarians, support staff and pet owners should improve adherence to the wellness plan, thus improving the quality of health care delivered to cats.
- ❖ More robust data about disease incidence by age would assist practitioners in determining the value and desired frequency of routine wellness testing.

Most owners are unaware that dental disease can threaten the health and welfare of their cats.

Acknowledgements

The AAFP and AAHA would like to thank Boehringer Ingelheim, Merial Ltd, Pfizer Animal Health and IDEXX Laboratories for their sponsorship of these guidelines and their commitment to help the veterinary community develop projects that will improve the lives of cats.
